

stockpilot.

Supply disrupted. Recovery, verified.

An AI operations workspace that turns urgent order goals into approved, executed outcomes.

LIVE GEMINI + MONGODB ATLAS

01 Plan

Understand the goal

02 Approve

Keep purchasing accountable

03 Act + verify

Prove the business outcome

Urgent orders turn into a coordination problem.

For operations managers, inventory coordinators and purchasing approvers.

Inventory is short

Orders need 30 units.
Only 8 are on hand.
The shortfall must be sourced.

Suppliers change

Price, stock and lead time
can change while a purchase
is waiting for approval.

Decisions need control

Budgets, deadlines and
approvals must stay
consistent with the latest
business state.

The gap: one accountable workflow across inventory, procurement and verification.

One goal in. A verified recovery plan out.

**“Recover both urgent sensor orders within four days. Reserve available stock,
purchase only the shortfall, verify allocations and publish a report.”**

SCOPE: TWO ORDERS

BUDGET: \$1,500

DEADLINE: 4 DAYS

Understand

Read current records

Plan

Delegate specialist work

Act

Use controlled tools

Prove

Verify and report

The goal guides planning. Explicit scope, budget and deadline remain authoritative.

Six roles. One coordinated workflow.

Scoped Gemini invocations + structured contracts + durable, sequential handoffs.

From goal to action — with a recovery loop.

Changed-state failures feed fresh observations into a new plan; committed actions persist.

AI reasoning meets a durable execution engine.

AI proposes. The backend enforces.

Role + scope permissions

Agents receive only approved tools and owned order/SKU scope.

Structured input validation

Exact tool schemas and grounded memory IDs are checked before execution.

Exact-action approvals

Cumulative purchasing above \$250 pauses for a persisted decision.

Fresh business invariants

Quote version, budget, uncovered demand and deadline are rechecked.

JWT + tenant ownership Backend-only keys Atomic writes + replay receipts

The demo: recover when the supplier changes.

30 NEEDED

8 ON HAND

22 TO SOURCE

4-DAY DEADLINE

Plan A: supplier A

$22 \times \$30 = \660
2-day lead time
Purchase awaits approval.

Quote changed

Supplier stock is withdrawn.
The approved stale quote fails: QUOTE_CHANGED.

Plan B: supplier B

$22 \times \$36 = \792
3-day lead time
Fresh approval → commit.

8 reserved + 22 scheduled = 30 allocated units. Budget and deadline checks pass.

Measured execution. A verified outcome.

Live API-derived analytics

The acceptance proved

Real plans and tool mutations
Two persisted approvals
Stale-quote recovery
Independent checks + final report

Every decision leaves visible evidence.

Plans + history

Inspect revisions and handoffs.

Actions + approvals

See exact inputs and results.

Audit + exports

Trace and export the outcome.

Less coordination. More accountability.

Operations

Coordinate stock, quotes and allocation in one live workflow.

Purchasing

Keep high-risk commitments bound to an exact decision.

Audit

Trace model decisions to actual actions and verified outcomes.

Roadmap

NEXT

Public deployment
Hosted verification + demo video

THEN

Supplier / ERP adapters
External notifications

LATER

Multi-SKU planning
Organization approvals + scaling

stockpilot.

**Give the system a goal.
Get an outcome you can prove.**

Plans adapt. Purchases stay accountable.
Business outcomes are independently verified.

Backup: actual Gemini invocation records.

The screenshot displays the Gemini Agents interface. On the left, under the 'Agents (17)' tab, a list of agents is shown, each with a 'Completed' status:

- Orchestrator agent**
gemini · gemini-3.5-flash-lite · v1 · attempt 1 · Oct 6, 08:22:53 AM
▶ Validated output / failure
- Research agent**
gemini · gemini-3.5-flash-lite · v1 · attempt 1 · Oct 6, 08:22:56 AM
▶ Validated output / failure
- Analysis agent**
gemini · gemini-3.5-flash-lite · v1 · attempt 1 · Oct 6, 08:23:08 AM
▶ Validated output / failure
- Execution agent**
gemini · gemini-3.5-flash-lite · v1 · attempt 1 · Oct 6, 08:23:19 AM
▶ Validated output / failure
- Research agent**
gemini · gemini-3.5-flash-lite · v1 · attempt 1 · Oct 6, 08:23:39 AM
▶ Validated output / failure

On the right, the 'Execution trail' section shows a list of events:

- Workflow completed** (Oct 6, 08:26:08 AM)
Verified fulfillment plan completed; incoming supply is scheduled
▶ Inspect evidence
- State changed** (Oct 6, 08:26:08 AM)
Workflow → COMPLETED
▶ Inspect evidence
- Completion invariant checked** (Oct 6, 08:26:08 AM)
Fresh internal completion check read the business ledger
▶ Inspect evidence
- State changed** (Oct 6, 08:26:07 AM)
Workflow → EXECUTING
▶ Inspect evidence
- Tool completed** (Oct 6, 08:26:07 AM)
publish_report completed
▶ Inspect evidence

Separate scoped calls

Provider, model, role, revision, attempts and validated output are persisted.

Failures remain visible

Correction and recovery records are retained rather than replaced by success-only history.

Backup: eight tools and persistent proof.

Backup: answers to the hard questions.

Why agentic AI?

Goal-driven plans and tool choices adapt to observed state. The backend handles arithmetic and policy.

What does “completed” mean?

All requested supply is reserved or scheduled and allocated; checks and a report pass. Not physical delivery.

Can the model bypass approval?

No. Exact approval binding and independent backend permissions remain authoritative.

What remains to ship?

Public deployment, hosted verification, demo video, external integrations and broader live evaluation.
